Association of Mobility Changes with Rate of COVID-19 Cases

The Pearson's correlation between the COVID-19 increase rate and **travel distance change rate** and **home dwell time change rate** was **-0.586** (95% CI: -0.742 ~ -0.370) and **0.526** (95% CI: 0.293 ~ 0.700).

Gao S, Rao J, Kang Y, Liang Y, Kruse J, Dopfer D, Sethi A, Reyes J, Yandell B, and Patz J. (2020) Association of mobile phone location data indications of travel and stay-at-home mandates with COVID-19 infection rates in the US. *JAMA Network Open*. 2020;3(9):e2020485.

The Effects of Stay-at-Home Mandates

Increases in state doubling time ranged from 1.04 ~ 6.86 (median: 2.7) days to 3.66 ~ 30.29 (median: 6.0) days after orders.

These social distancing tips can help you stay safe outside 01:30

(CNN) — When people obeyed stay-at-home orders this past spring, it reduced the spread of Covid-19, according to new research published Tuesday.

"These findings suggest that stay-at-home social distancing mandates, when they were followed by measurable mobility changes, were associated with reduction in Covid-19 cases," the researchers from University of Wisconsin-Madison wrote in the study published in the journal *JAMA Network Open*.

They used location data from more than 45 million cellphones between March 11 and April 10 to work out daily travel distance and time spent at home across all 50 states. This helped them judge how well people obeyed social distancing mandates.

It looks like they did, to some degree.

Kang, Y., Gao, S., Liang, Y., Li, M., Rao, J., & Kruse, J. (2020). Multiscale Dynamic Human Mobility Flow Dataset in the US during the COVID-19 Epidemic. *Scientific Data*. Preprint at arXiv:2008.12238.

<https://github.com/GeoDS/COVID19USFlows>

The visitor flows at three spatial scales are based on 10% of the entire population in the US. Using the American Community Survey (ACS) population data with mobile phone visitor patterns, the dynamic population-scale flows are estimated as:

$$pop_flows(o, d) = visitor_flows(o, d) \times \frac{pop(o)}{num_devices(o)}$$

geoid_o	geoid_d	lng_o	lat_o	lng_d	lat_d	date_range	visitor_flows	pop_flows
01	01	-86.8445209956579	32.75687994183124	-86.8445209956579	32.75687994183124	2020-03-01	1074126	10716851.0
01	02	-86.8445209956579	32.75687994183124	-151.25054883603903	63.78846947897309	2020-03-01	50	498.0

We also compare the estimation results with a **gravity** model and a **radiation** model.

Gravity Model

Radiation Model

$$F_{i,j} = \frac{k * P_i * P_j}{d_{i,j}^\beta}$$

$$T_i = m_i \frac{N_c}{N}$$

$$T_{i,j} = T_i \frac{m_i * n_j}{(m_i + S_{ij}) * (m_i + n_j + S_{ij})}$$

Date	Gravity Model		Radiation Model		
	k	β	correlation	Nc/N	correlation

- Dynamic population flows are inferred based on the parameters.
- The correlation coefficients between the population flows and the flows estimated by gravity model and radiation model are calculated.

Comparison with Other Data Sources

- Comparison of the population flows with Descartes Lab's COVID-19 mobility changes dataset:
<https://github.com/descarteslabs/DL-COVID-19>

Weekly Flow Data				Daily Flow Data			
Date	Type	Matched Records	Pearson Correlation Coefficient	Date	Type	Matched Records	Pearson Correlation Coefficient
3/2/2020	Visitor Flows	102750	0.961	3/2/2020	Visitor Flows	102206	0.953
3/2/2020	Population Flows		0.984	3/2/2020	Population Flows		0.985
4/6/2020	Visitor Flows	78577	0.932	4/6/2020	Visitor Flows	92297	0.935
4/6/2020	Population Flows		0.981	4/6/2020	Population Flows		0.98
5/11/2020	Visitor Flows	91069	0.917	5/11/2020	Visitor Flows	94729	0.934
5/11/2020	Population Flows		0.977	5/11/2020	Population Flows		0.981
5/25/2020	Visitor Flows	95350	0.915	5/25/2020	Visitor Flows	99037	0.934
5/25/2020	Population Flows		0.974	5/25/2020	Population Flows		0.980

- High correlation coefficients (greater than 0.9) show the reliability of the generated mobility flow dataset.

Metropolitan Area	Pearson Correlation Coefficient
New York	0.977
Los Angeles	0.956
Chicago	0.928
Houston	0.92
Seattle	0.951

$$\begin{cases}
 \frac{dS_i}{dt} = -\frac{b_i S_i (A_i + \gamma E_i)}{P_i} + \sum_{j \neq i} \alpha_t n_{ij} \frac{S_j}{P_j} - \sum_{j \neq i} \alpha_t n_{ji} \frac{S_i}{P_i} \\
 \frac{dE_i}{dt} = \frac{b_i S_i (A_i + \gamma E_i)}{P_i} - \frac{E_i}{D_e} + \sum_{j \neq i} \alpha_t n_{ij} \frac{E_j}{P_j} - \sum_{j \neq i} \alpha_t n_{ji} \frac{E_i}{P_i} \\
 \frac{dI_i}{dt} = r_i \frac{E_i}{D_e} - c_I \frac{I_i}{D_c} - (1 - c_I) \frac{I_i}{D_l} \\

<https://github.com/GeoDS/Travel-Network-SEIR>

- Mobile phone data can help track the mobility patterns and digital contact tracing;
- Spatial and temporal heterogeneity of transmission;
- Health and social disparities require more attention;
- Fighting against COVID-19 requires coordination efforts and multidisciplinary collaboration
